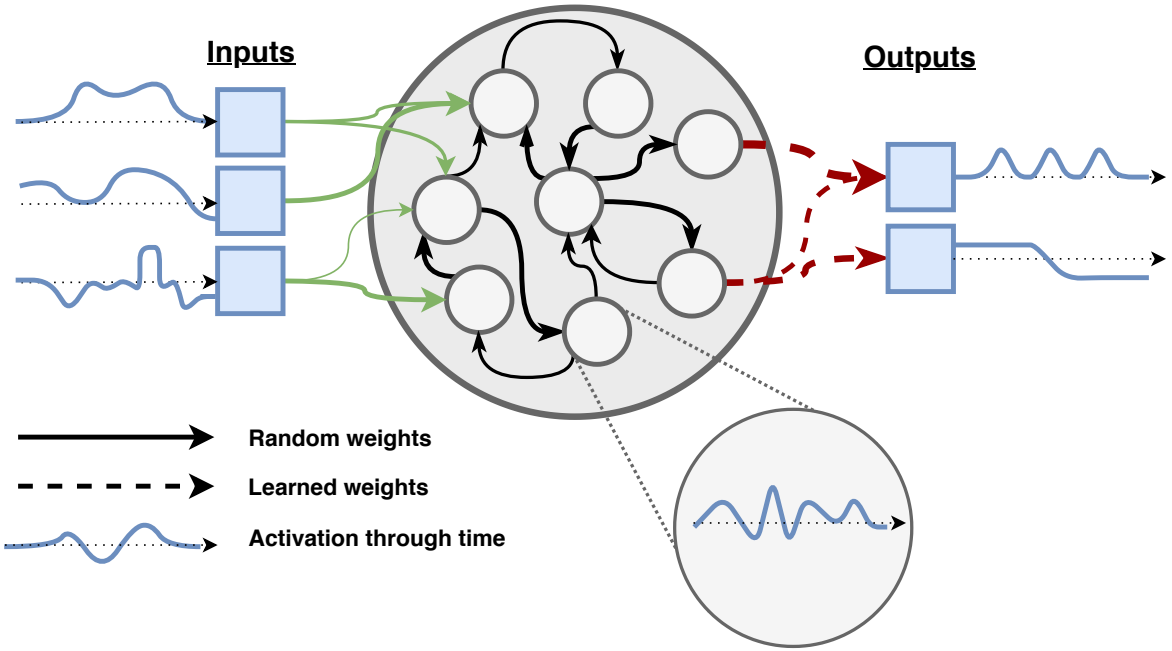
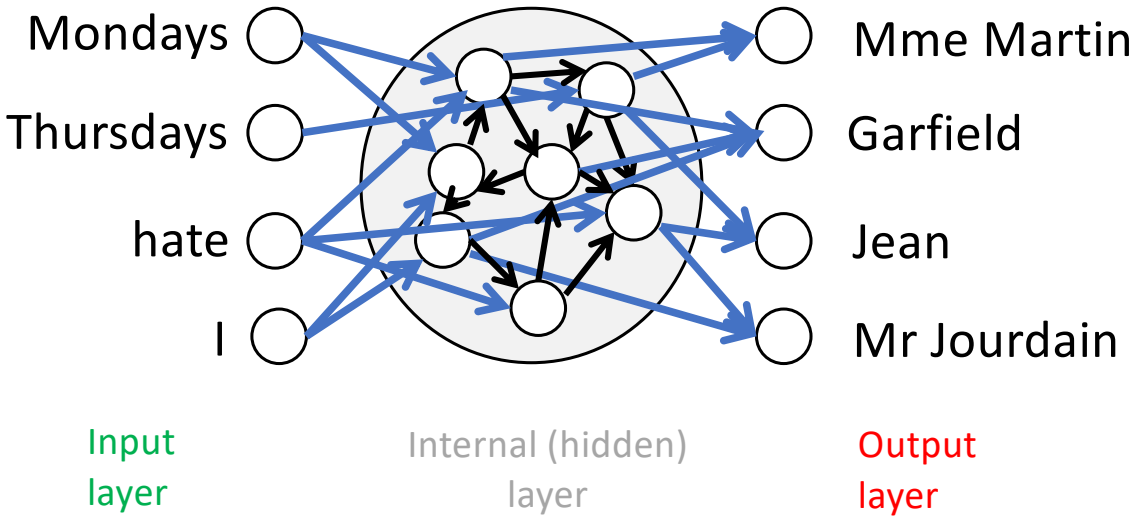
Reservoir Computing

Ceci n'est pas un réseau de neurones récurrent (RNN) classique !

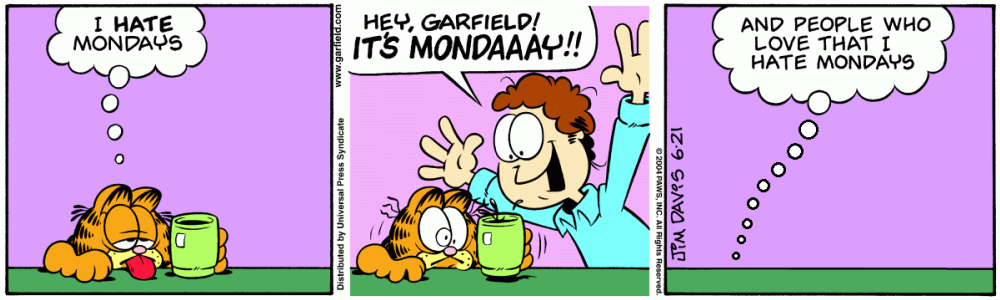


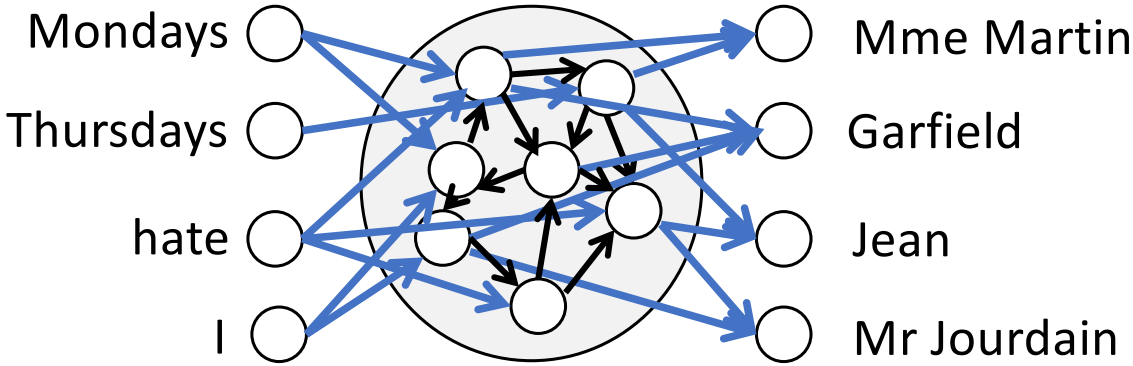
Juven & Hinaut 2020

Le Reservoir Computing exploite les dynamiques naturelles d'un réseau récurrent aléatoire



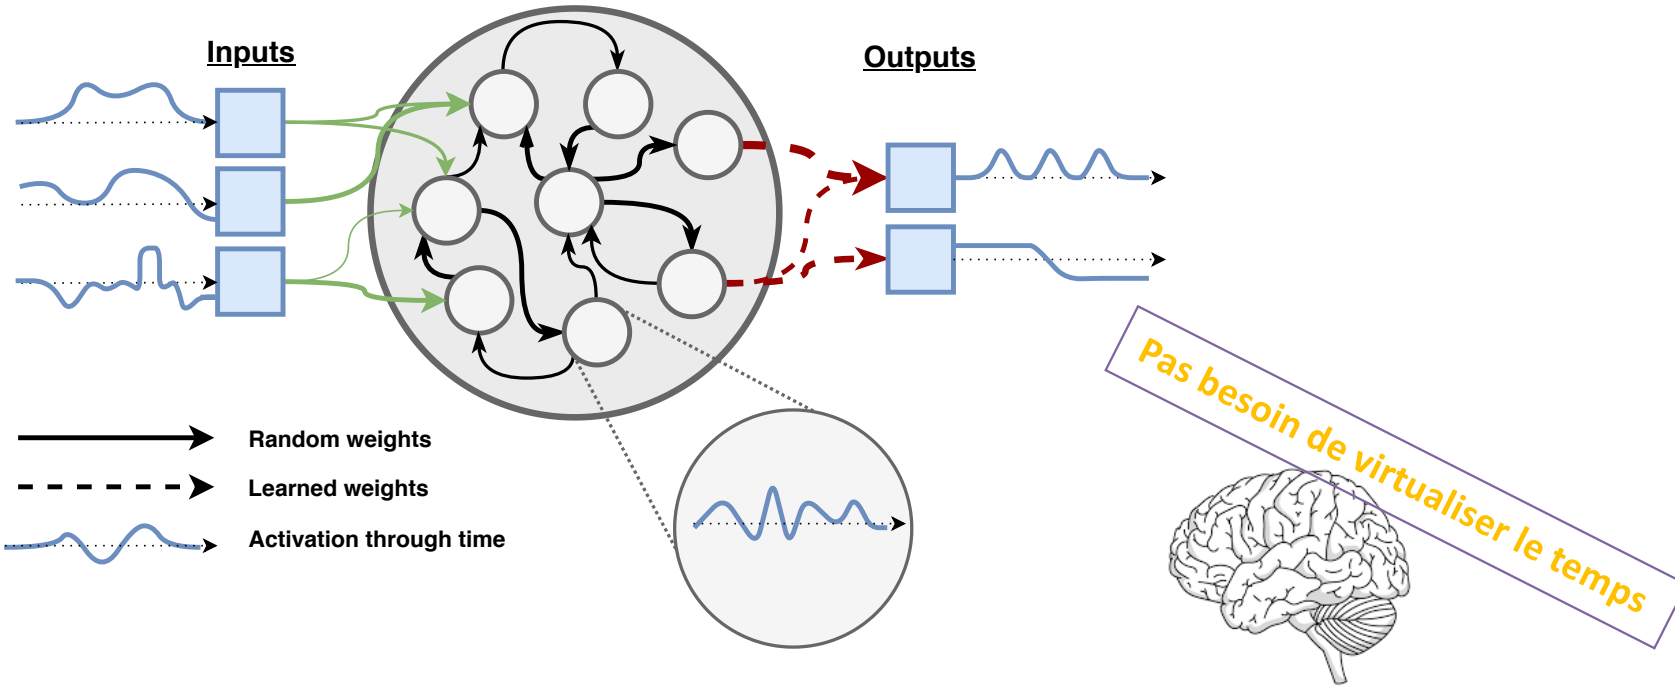
Le Reservoir Computing exploite les dynamiques naturelles d'un réseau récurrent aléatoire





Reservoir Computing

Poids aléatoires, MAIS dynamiques déterministes !

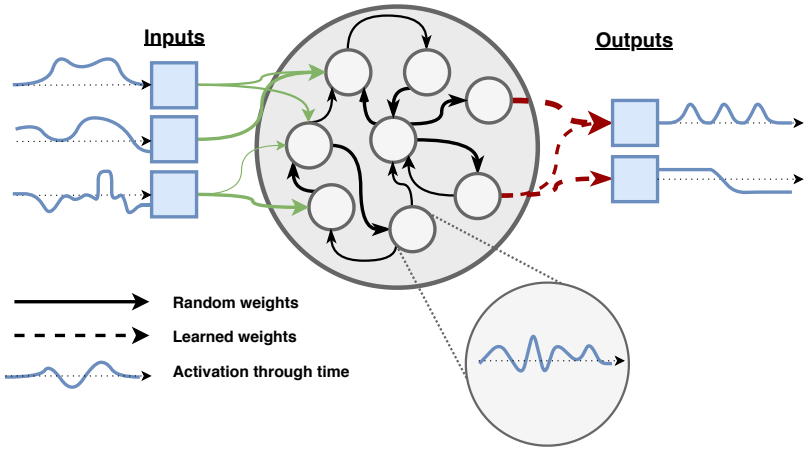


Poids aléatoires = pas d'a priori sur les connexions

Seulement 20 W !

Juven & Hinaut 2020

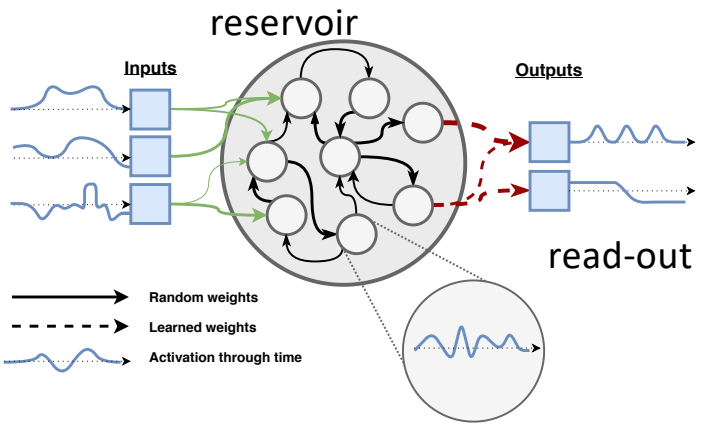
Dominey 1995, Jaeger 2001, Maas et al. 2002 ...

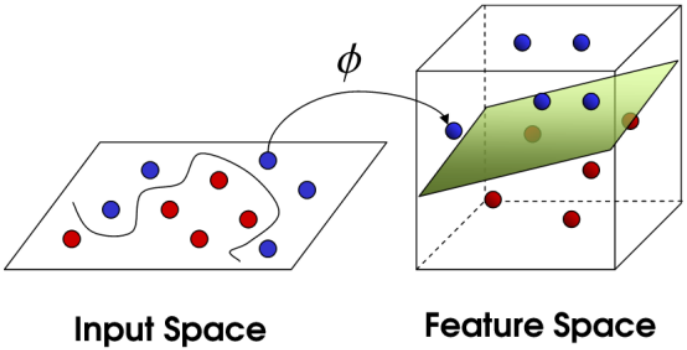


Inputs
Outputs
Random weights
Learned weights
Activation through time

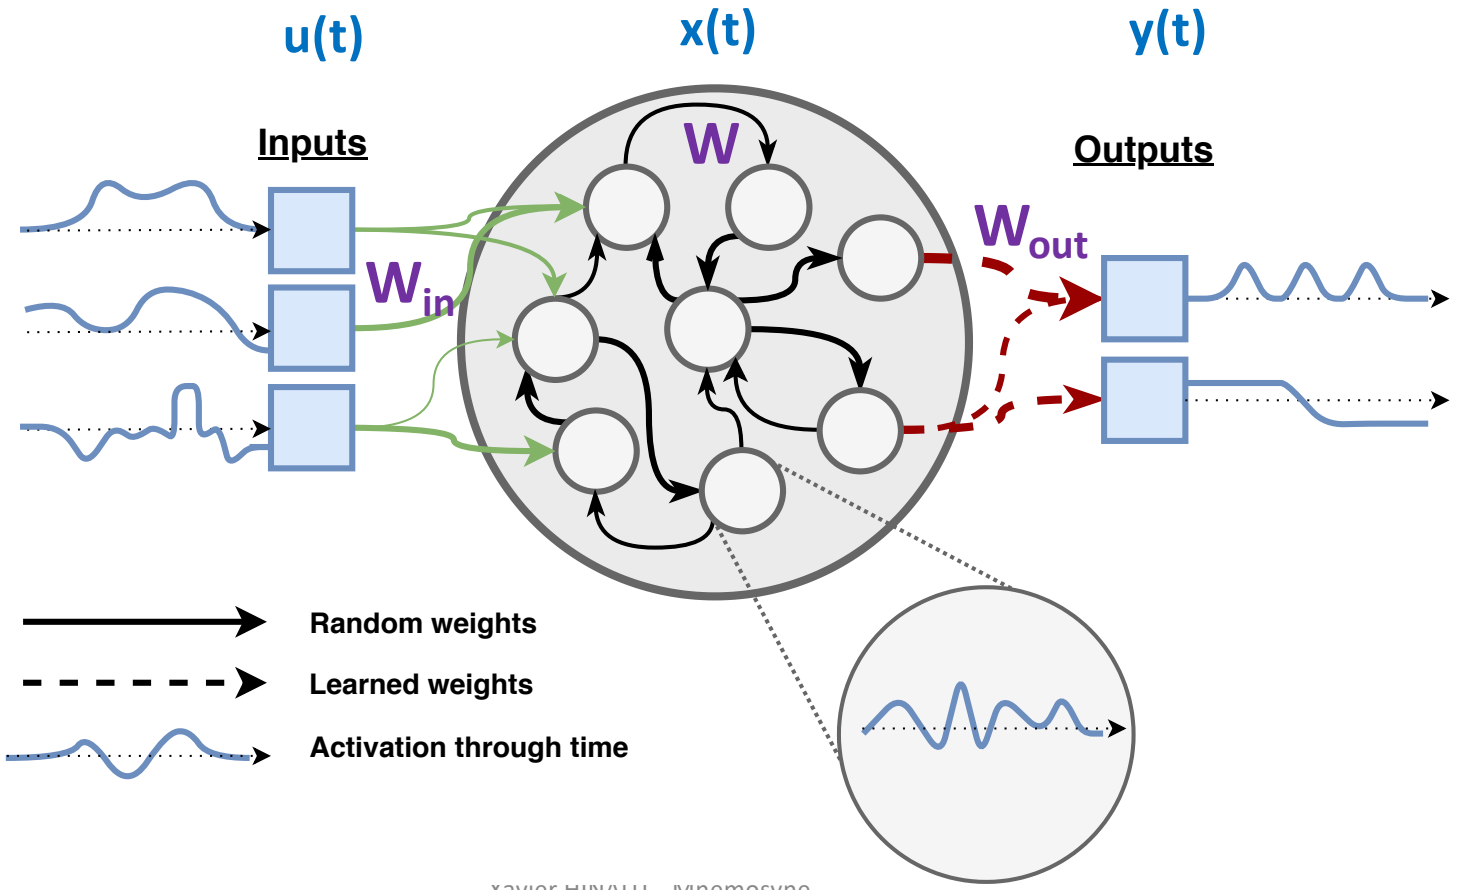
Pourquoi ce nom ?

- Réservoir = couche récurrente
- read-out = couche de sortie
- beaucoup de combinaisons des entrées sont faites dans le reservoir
  - grâce aux projections aléatoires
- “réservoir” est littérallement un réservoir de calculs (= “reservoir computing”)
  - calculs non-linéaires
- dans lequel on vient “piocher”/décoder (= ”read-out”) linéairement
  - les combinaisons qui vont être utiles pour le problème





Reservoir Computing

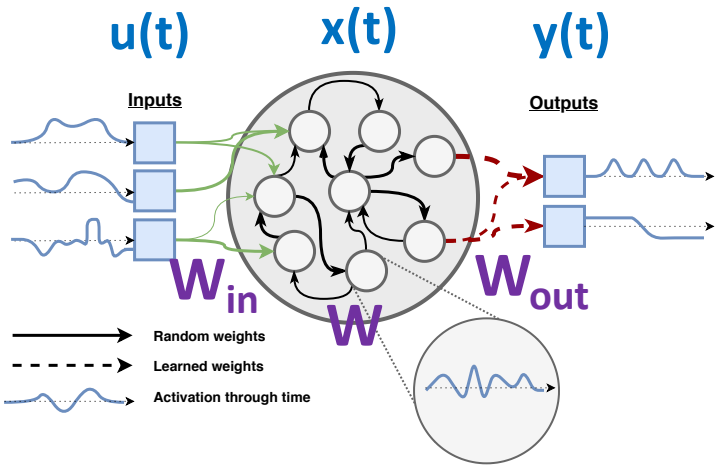


NE REGARDEZ PAS LA PROCHAINE DIAPO !

Reservoir Computing: Echo State Network (ESN)

Reservoir state update $x(t) = \left(1 - \frac{1}{\tau}\right) x(t-1) + \frac{1}{\tau} f(W^{in} u(t) + W x(t-1))$

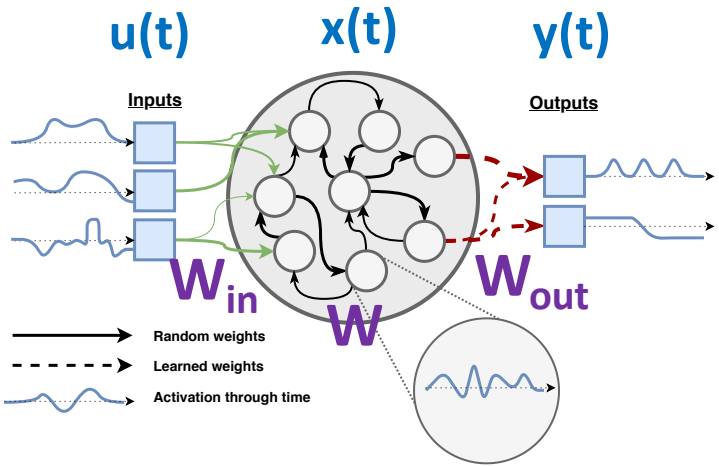
Output (« read-out ») update



Reservoir Computing: Echo State Network (ESN)

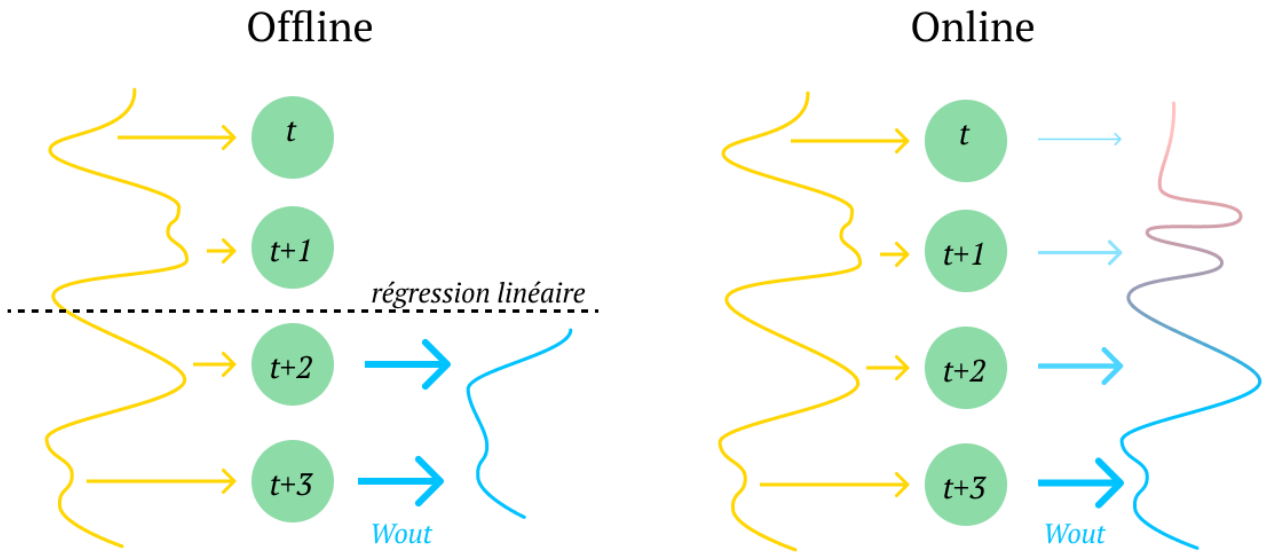
Reservoir state update $x(t) = \left(1 - \frac{1}{\tau}\right) x(t-1) + \frac{1}{\tau} f(W^{in} u(t) + W x(t-1))$

Output (« read-out ») update $y(t) = W^{out} x(t)$

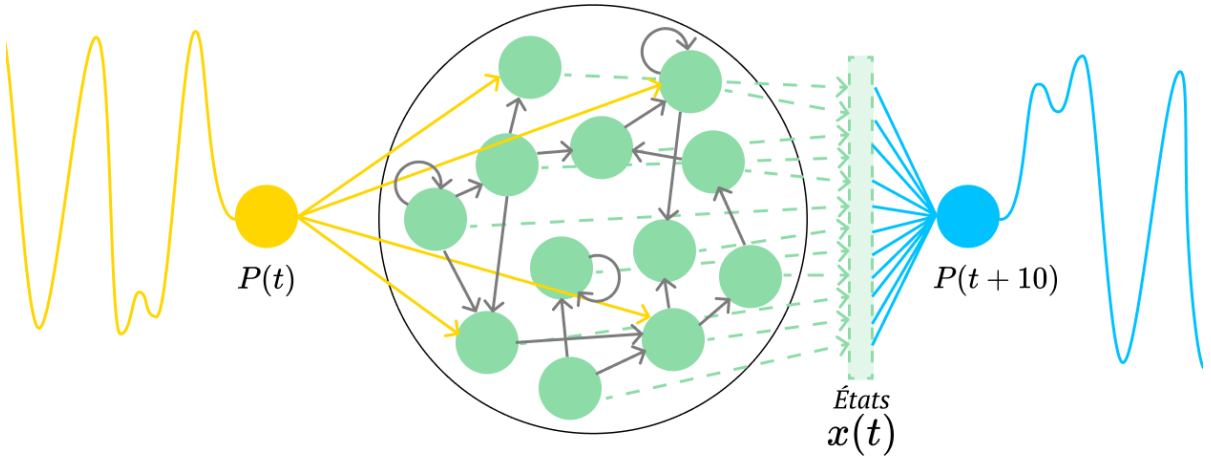


- $u(t)$: inputs
- W^{in}, W, W^{out}: input, recurrent, output matrices
- W^{in} and W matrices are kept random
- Only W^{out} is trained (e.g. ridge regression)
- τ : time constant of reservoir units
  - *leak rate* (LR) is often used instead of $\frac{1}{\tau}$
- f : activation function (usually $tanh$)

Apprentissage “hors-ligne” vs. “en-ligne”



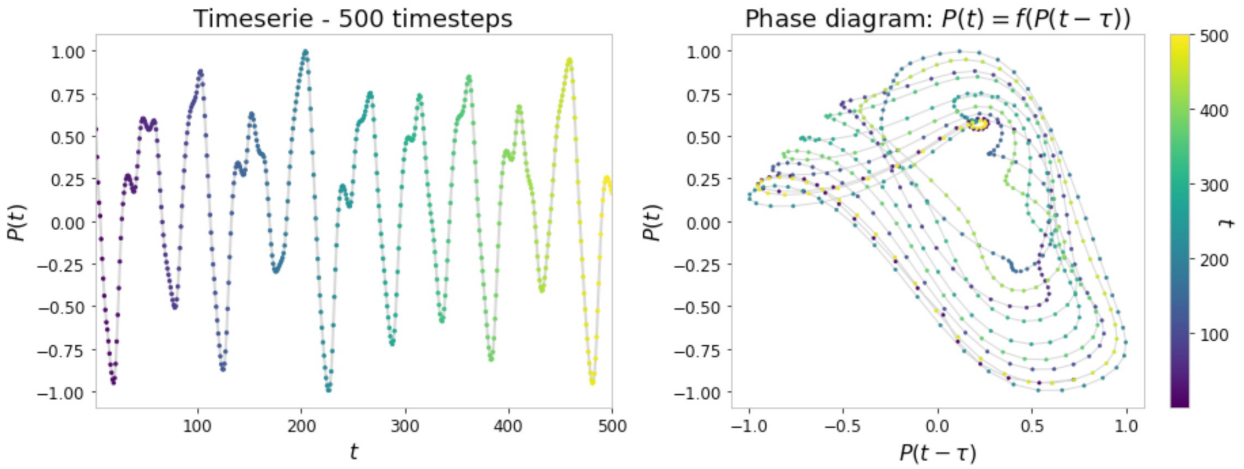
Prédiction de series temporelles



Prédiction de series temporelles

- Les réservoirs sont réputés pour leurs bonnes prédiction de séries temporelles difficiles
  - ex: séries chaotiques (ici Mackey & Glass)

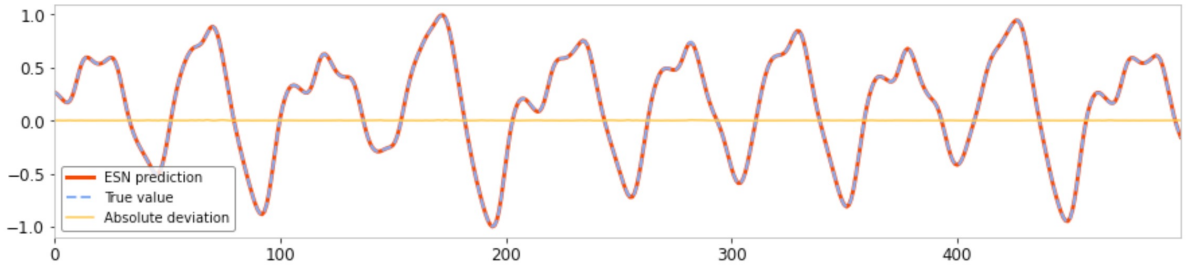
```
plot_mackey_glass(X, t, 500, tau)
```



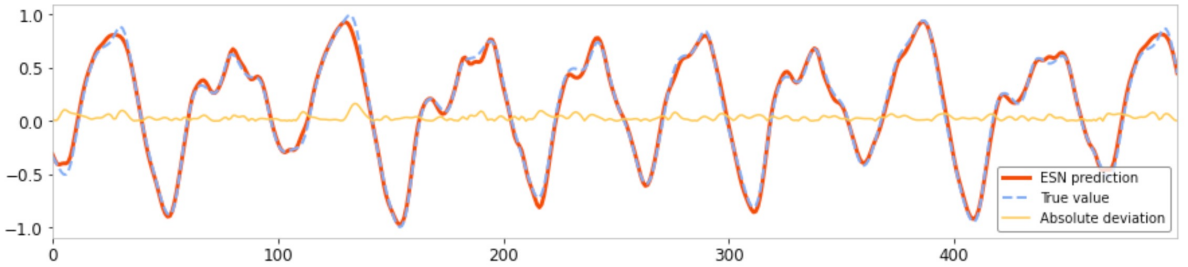
Exemple tiré de github.com/reservoirpy/reservoirpy

Prédiction de series temporelles

- Ex : série chaotique de Mackey & Glass
  - Prédictions obtenues pour 10 pas de temps dans le futur (T+10)



- Prédictions obtenues pour 50 pas de temps dans le futur (T+50)



Exemple tiré de github.com/reservoirpy/reservoirpy

Génération de series temporelles

Génération de séquences en « faisant boucler » la sortie sur les entrées

= Mode « Autorégressif » comme ChatGPT

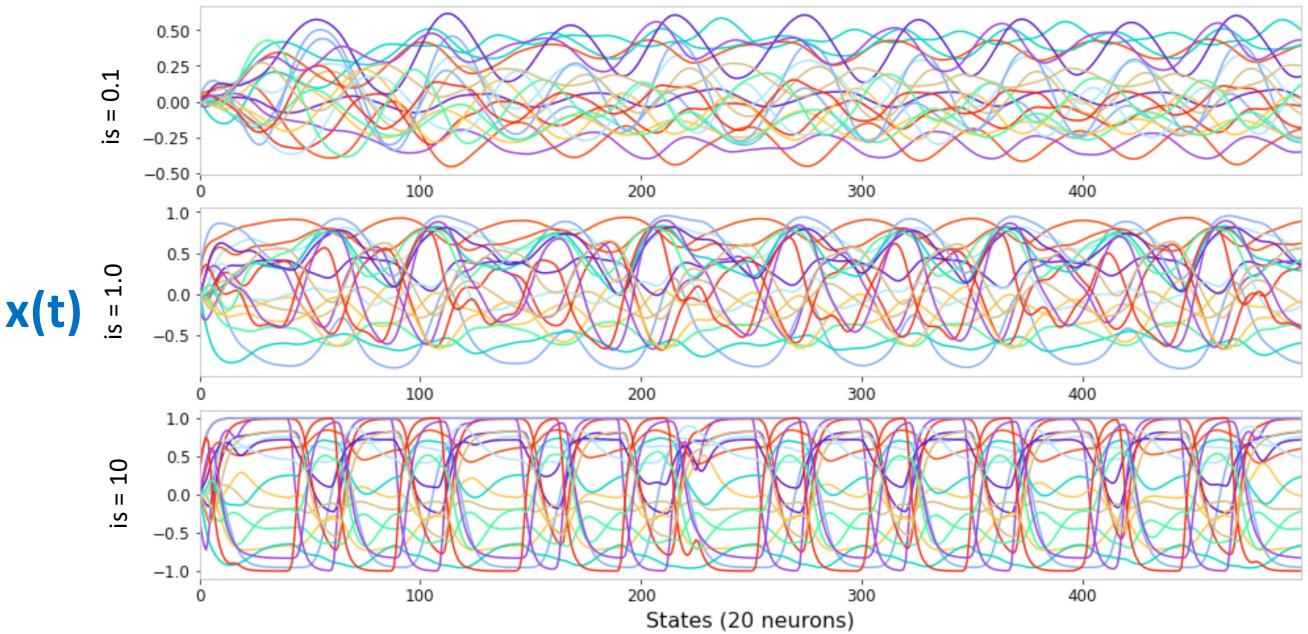
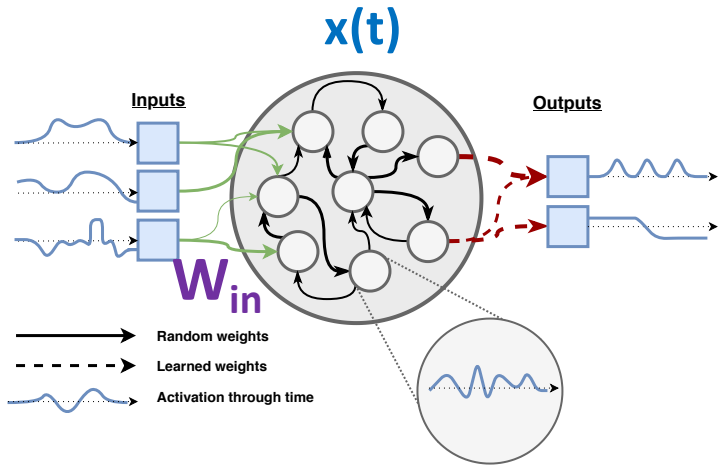
En pratique ? (Hypster-paramètres)

Input Scaling

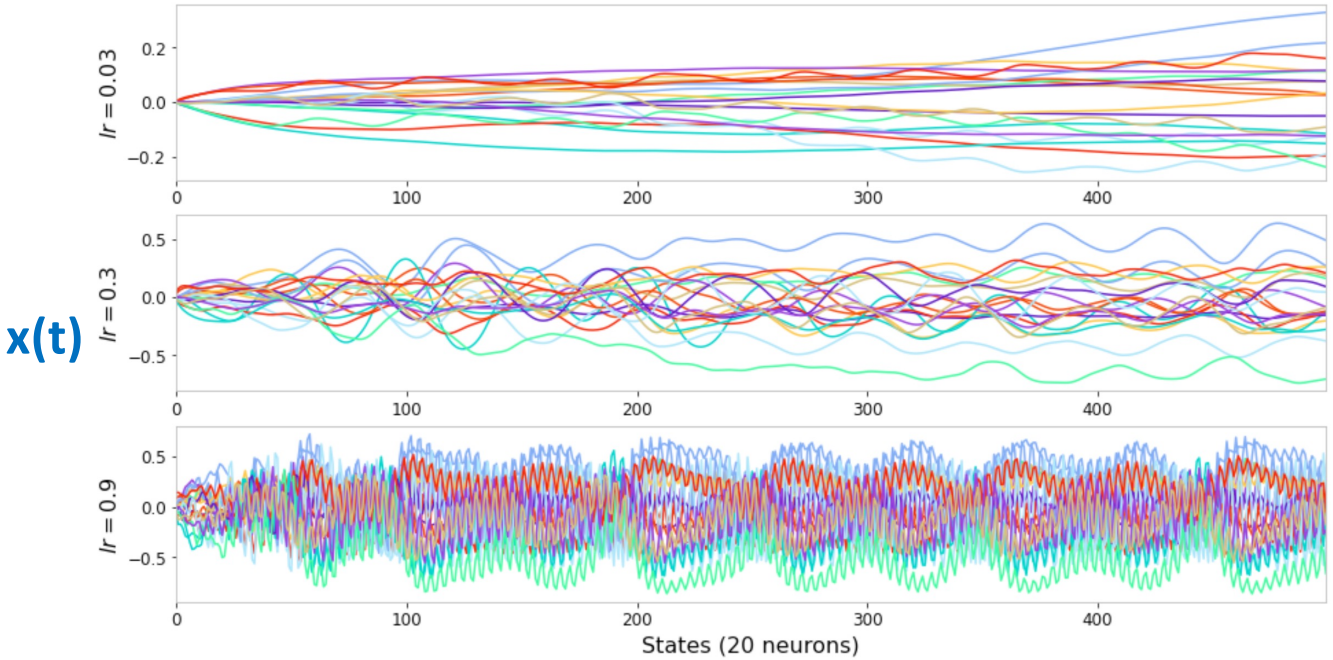
= scaling des connexions entrantes

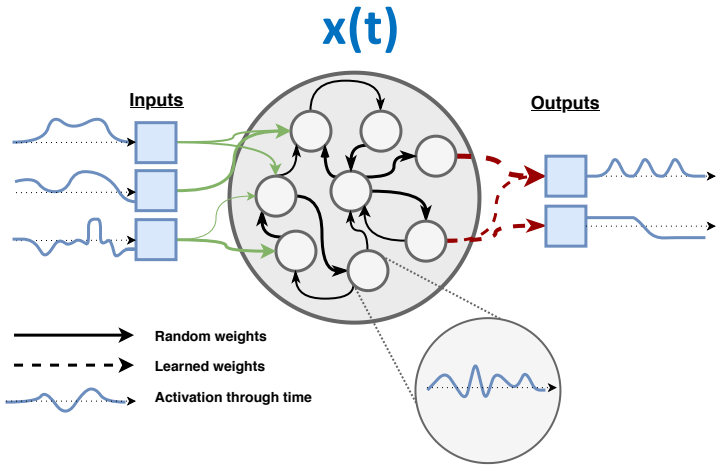


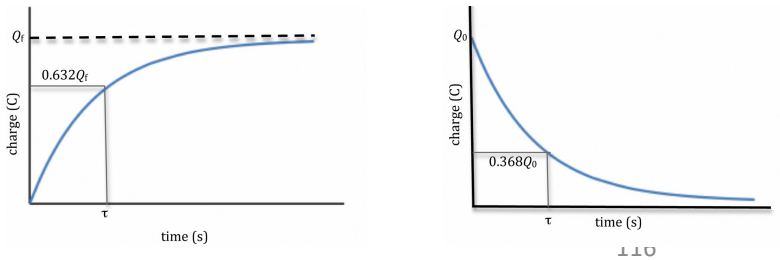


Leak-rate (=taux de fuite)

= inverse de la constante de temps des neurones

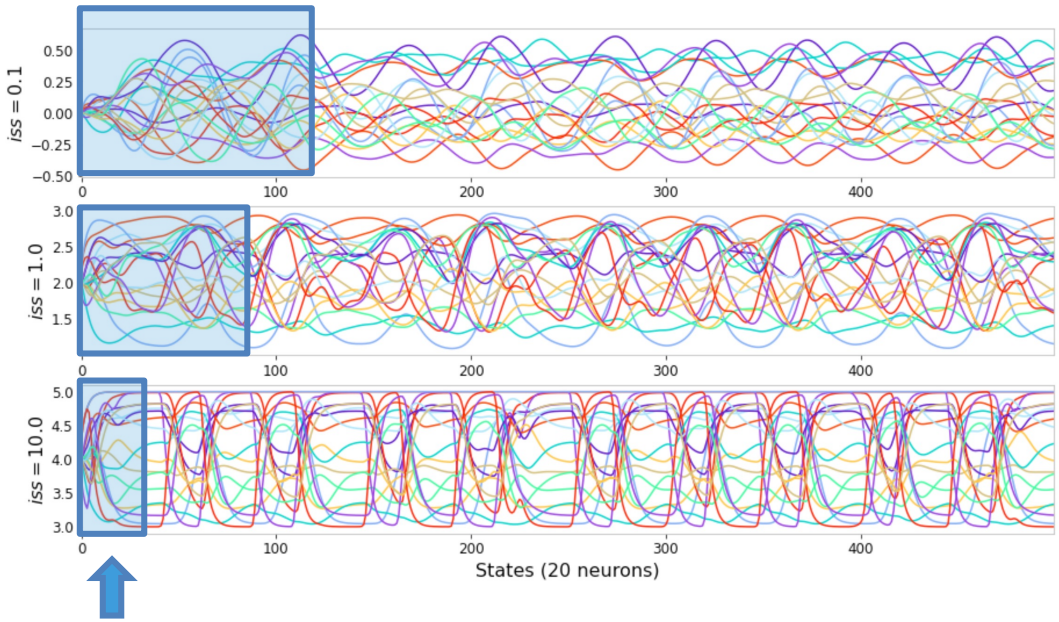






« Warming up »

warmup
ou
warming up

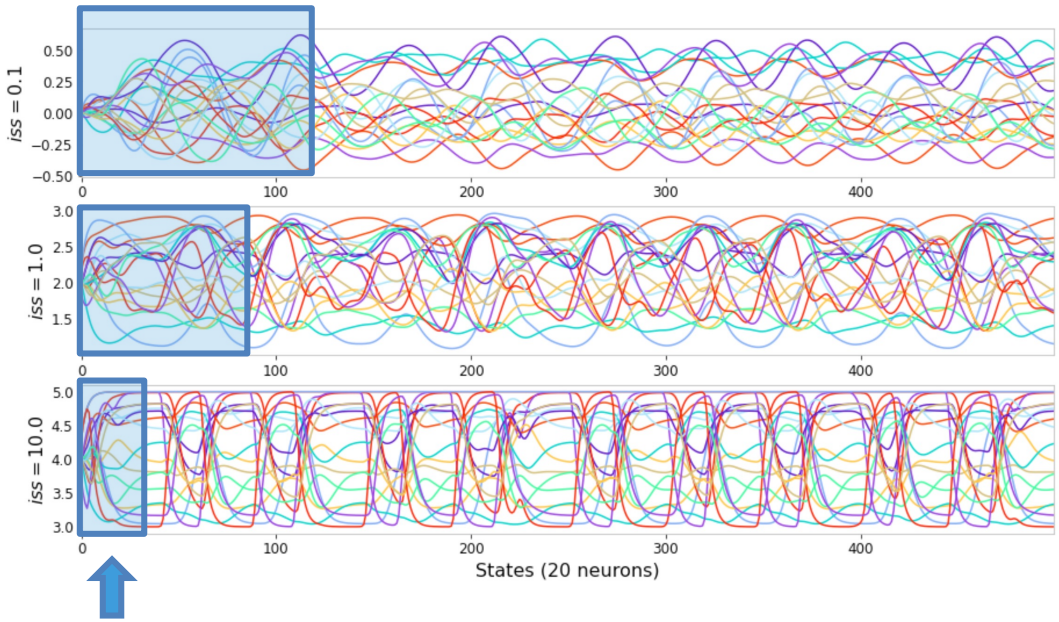


x(t)

- Le *warmup* est le « temps de chauffe » nécessaire pour que les dynamiques soient dans un rythme de « croisière ».
  - = zone bleue sur chaque figure
- Cela correspond au temps nécessaire pour que le réseau ne fasse plus vraiment la différence entre le début ou le milieu de la série temporelle (c-à-d après la zone bleue).
- = si je copie/colle un bout de graphique après le *warmup* vous ne serez pas capable de distinguer s'il s'agit du début/milieu/fin du graphique.

« Warming up »

warmup
ou
warming up



x(t)

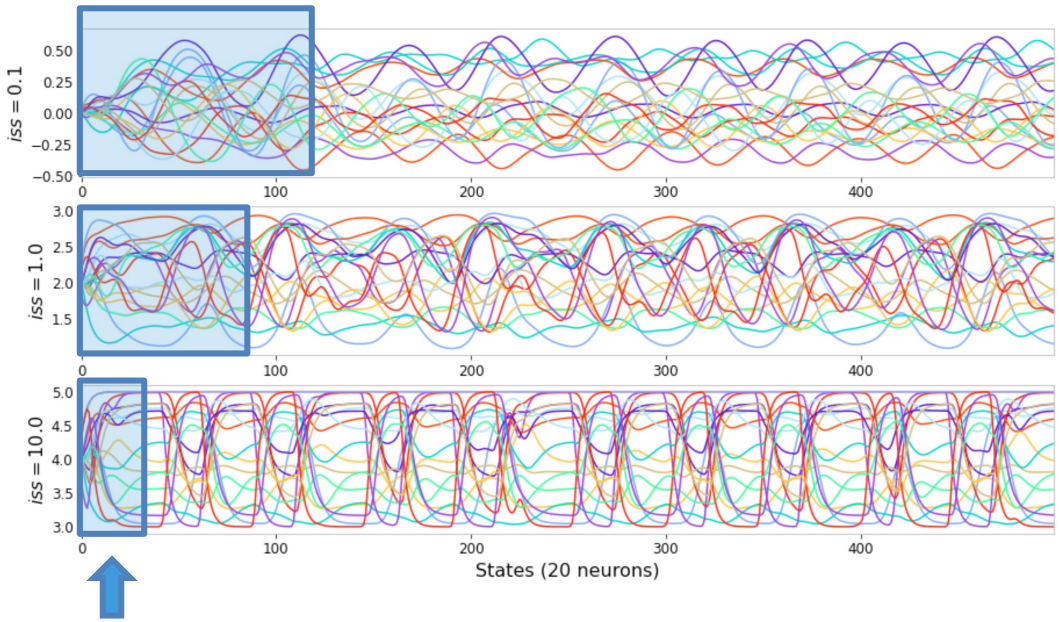
A priori, vous ne voulez pas utilisez ces dynamiques initiales du réservoir qui peuvent perturber l'apprentissage de votre tâche.

→ En conséquence, il faut définir l'hyperparamètre *warmup*

- « à l'œil » par rapport aux activités internes du réservoir
- et/ou en testant par essai/erreur pour quel *warmup* minimal vous avez des performances qui ne changent plus

« Warming up »

warmup
ou
warming up



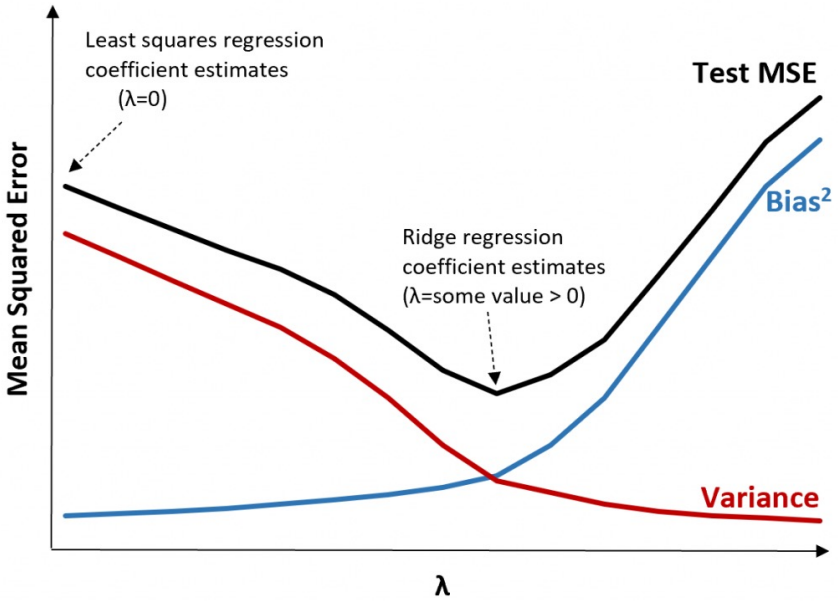
x(t)

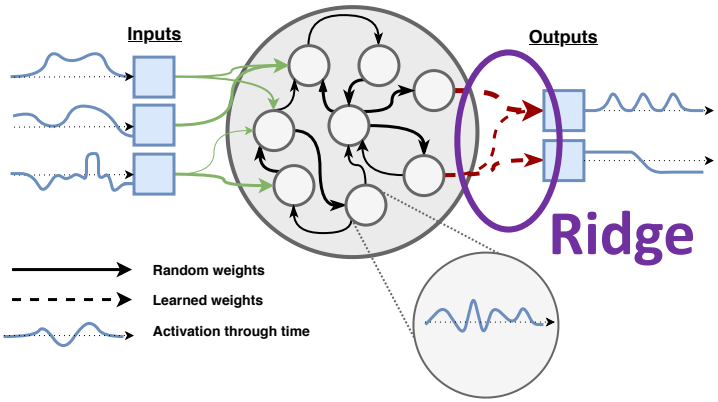
Ce *warmup* / « temps de chauffe » dépend

- des hyperparamètres du réservoir
  - (ici l'input scaling *iss*)
- des entrées / des données que vous donnez au réservoir
  - (par ex. si le taux d'échantillonnage change)

Ridge

= régularisation de la régression linéaire

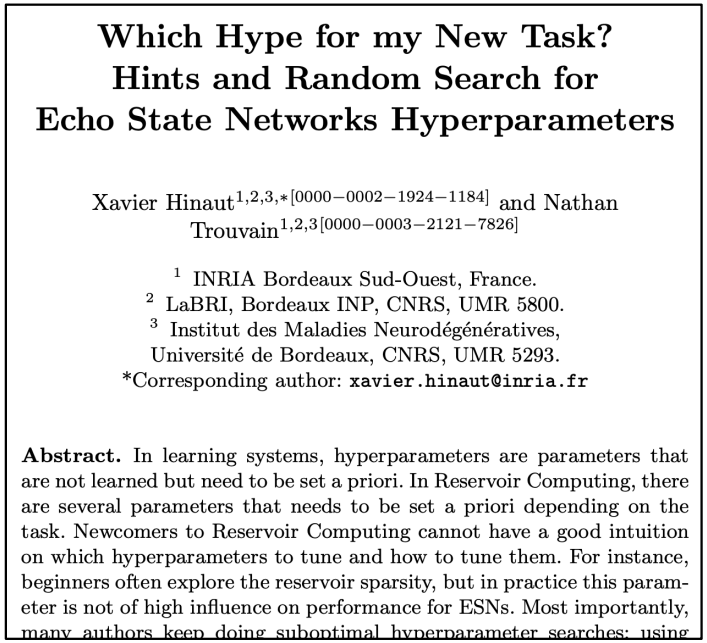




- Modèle avec variance élevée est très flexible
  - et s'adapte trop bien aux données d'entraînement, y compris le bruit
- Modèle avec biais élevé simplifie trop le problème
  - le modèle est trop simple pour capturer les relations sous-jacentes dans les données

Méthodes pour la recherche d'hyperparamètres

- « Random search » répétés et adpatés
  - Hinaut & Trouvain, ICANN 2021
  - Plus efficace que « grid search »



Which Hype for my New Task? Hints and Random Search for Echo State Networks Hyperparameters

Abstract. In learning systems, hyperparameters are parameters that are not learned but need to be set a priori. In Reservoir Computing, there are several parameters that needs to be set a priori depending on the task. Newcomers to Reservoir Computing cannot have a good intuition on which hyperparameters to tune and how to tune them. For instance, beginners often explore the reservoir sparsity, but in practice this parameter is not of high influence on performance for ESNs. Most importantly, many authors keep doing suboptimal hyperparameter searches: using

Reservoir Computing for Short High-Dimensional Time Series: an Application to SARS-CoV-2 Hospitalization Forecast

Thomas Ferté, Dan Dutartre, Boris P Hejblum, Romain Griffier, Vianney Jouhet, Rodolphe Thiébaut, Pierrick Legrand, Xavier Hinaut

Published: 02 May 2024, Last Modified: 25 Jun 2024 ICML 2024 Poster Everyone Revisions BibTeX

Abstract:
In this work, we aimed at forecasting the number of SARS-CoV-2 hospitalized patients at 14 days to help anticipate the bed requirements of a large scale hospital using public data and electronic health records data. Previous attempts led to mitigated performance in this high-dimension setting; we introduce a novel approach to time series forecasting by providing an alternative to conventional methods to deal with high number of potential features of interest (409 predictors). We integrate Reservoir Computing (RC) with feature selection using a genetic algorithm (GA) to gather optimal non-linear combinations of inputs to improve prediction in sample-efficient context. We illustrate that the RC-GA combination exhibits excellent performance in forecasting SARS-CoV-2 hospitalizations. This approach outperformed the use of RC alone and other conventional methods: LSTM, Transformers, Elastic-Net, XGBoost. Notably, this work marks the pioneering use of RC (along with GA) in the realm of short and high-dimensional time series, positioning it as a competitive and innovative approach in comparison to standard methods.

Choisissez le bon outil pour chaque problème

Si on a un marteau tous les problèmes sont des clous !

En Résumé

- Le Reservoir Computing permet de
  - Prédire / Générer / Classifier / Simuler
  - Entraînement *online* et *offline*
  - → données temporelles (et non-temporelles)
  - Se combine avec CNN, RL, …

- ReservoirPy propose une IA frugale
  - Bonnes performances même avec peu de données nécéssaires
  - Economie de calculs / temps
  - → Economie d'énergie !

- Transférable sur différents types de *hardware*
  - systèmes physiques optiques, magnétiques, biologiques, etc.

Les reseaux aléatoires peuvent

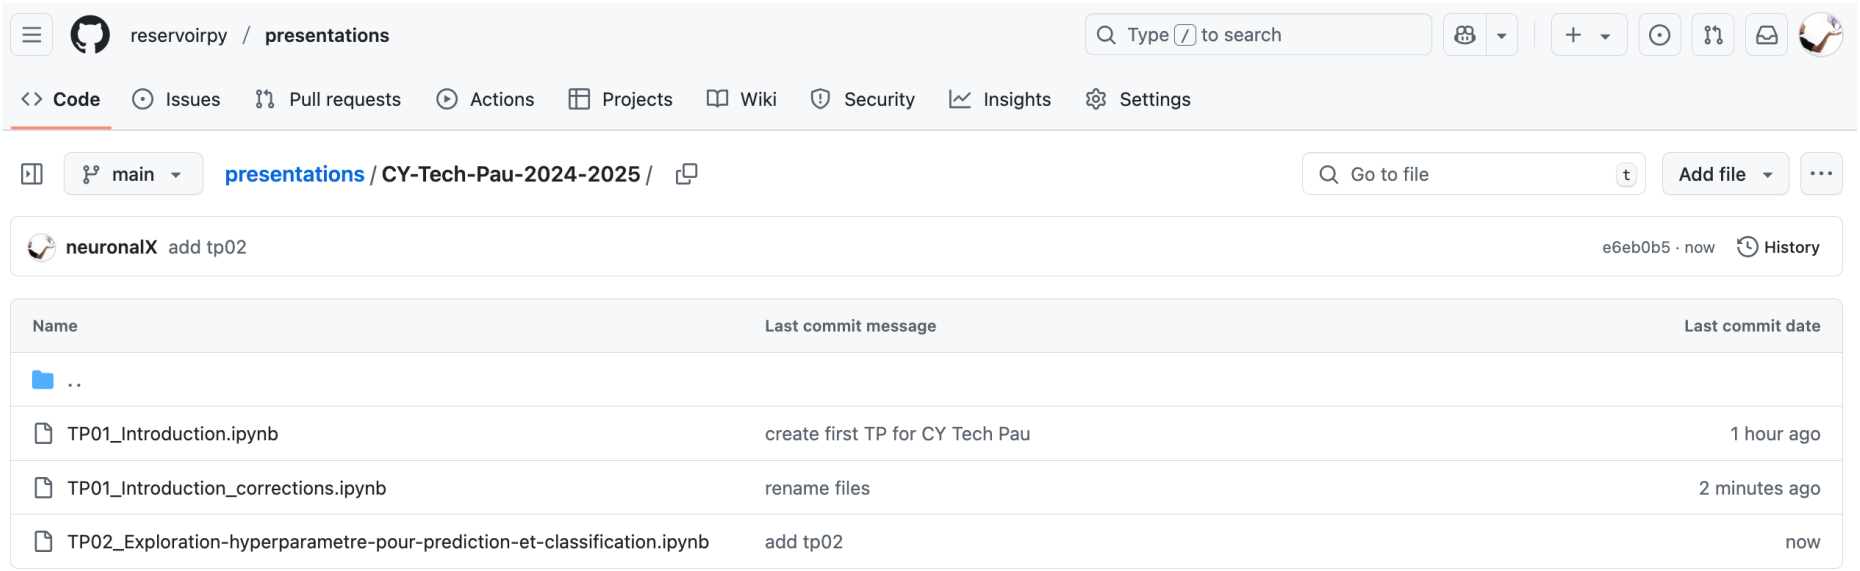
Vous devriez arriver sur une page qui ressemble à ça :



Astuces pour la partie TP

Attention ! Observer l'activité d'un modèle que vous définissez vous-même et observer l'activité d'un modèle fait avec un nœud ESN ne se fait pas de la même façon !

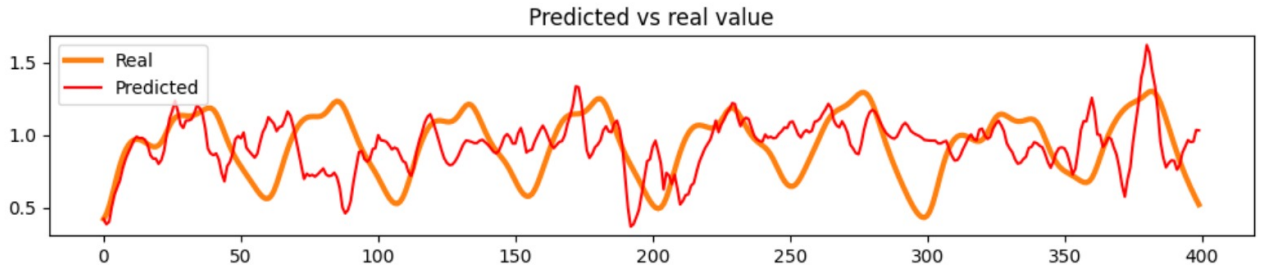
```
# A vous de jouer !
# Définissez et entrainez ci-dessous un modèle d'ESN en changeant les paramètres précédents

modelbis = ESN(
    units=100, # neurones dans le réservoir
    lr=0.3, # taux de fuite
    sr=10, # rayon spectral de la matrice de poids
    ridge=1e-8, # paramètre de régularisation
)

# Ajustement du modèle
modelbis.fit(x_train, y_train)

# Test du modèle
y_pred = modelbis.run(x_test)
```

```
# Observez les changements sur les valeurs prédites
plot_figure(y_test, y_pred)
```

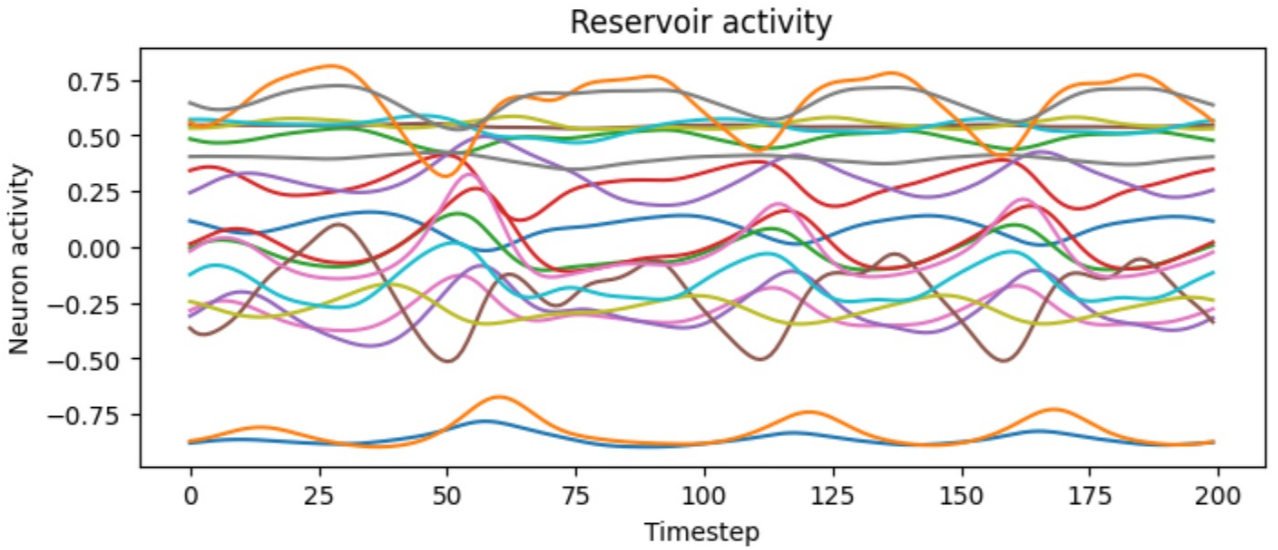


Astuces pour la partie TP

```
# Observez les changements sur l'activité des neurones

activity = reservoir.run(x_test)

plt.figure(figsize=(8, 3))
plt.plot(activity[:200, :20]) # 200 pas de temps, 20 neurones visualisés
plt.title("Reservoir activity")
plt.xlabel("Timestep")
plt.ylabel("Neuron activity")
plt.show()
```



Astuces pour la partie TP

```
# Ah mais c'est étrange !
# Cela ressemble exactement à l'activité que l'on avait avant ! Pourquoi ?
# -> Car nous avons regardé l'activité du 1er reservoir que nous avions créé
#    et pas l'ESN que nous utilisons actuellement !
# Pour analyser l'activité d'un ESN il faut récupérer les activités d'une autre façon :
activitybis = modelbis.run(x_test,
    return_states=["reservoir"]) # On ajoute la liste des noeuds dont on veut récupérer l'activité.

# /!\ Attention, ce que l'on récupère lorsque l'on spécifie "return_states" est un dictionnaire.
print(activitybis)

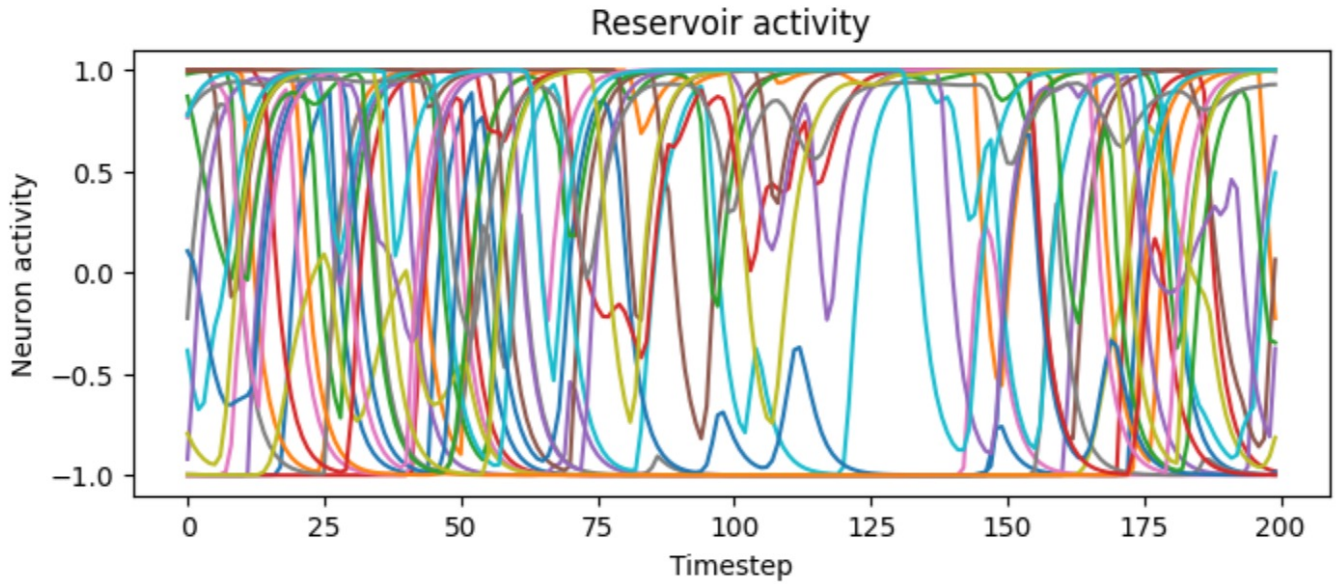
# Il faut donc récupérer l'activité de la façon suivante:
## activitybis['reservoir']
```

```
{'reservoir': array([[-0.99951318,  0.99862913,  0.86969742, ...,  0.99090729,
         0.99995465,  0.99953305],
       [-0.99965923,  0.99904   ,  0.75188303, ...,  0.99363316,
         0.99996795,  0.99907841],
       [-0.99976146,  0.99932762,  0.61087059, ...,  0.99554181,
         0.99997704,  0.86182414],
       ...,
       [-0.96744104, -0.03334604,  0.89825405, ..., -0.83357127,
        -0.45955163, -0.9704059 ],
       [-0.97634478, -0.323341  ,  0.92874884, ..., -0.88349989,
        -0.60656752, -0.97928413],
       [-0.96882611, -0.52633859,  0.95003025, ..., -0.91844992,
        -0.41795876, -0.98549889]])}
```

Astuces pour la partie TP

```
activitybis = modelbis.run(x_test,
    return_states=["reservoir"])

plt.figure(figsize=(8, 3))
plt.plot(activitybis['reservoir'][:200, :20]) # 200 pas de temps, 20 neurones visualisés
plt.title("Reservoir activity")
plt.xlabel("Timestep")
plt.ylabel("Neuron activity")
plt.show()
```



```
# Et effectivement là on obtient bien un autre type d'activité !
```
